"Measuring the Strength of a Magnetic Field by the Induction Method," Yu. Ya. Konakhovich,
G. D. Latyshev, V. V. Tsimbalin, Leningrad Physicotech Inst, Acad Sci USSR, 10 pp

"Iz Ak Nauk SSSR, Ser Fiz" Vol XIII, No 4

Describes apparatus for measuring the strength H of a magnetic field, which is distinguished from ordinary instruments by its high accuracy and by the possibility of continuous operation and convenience. Discusses block-diagram representing the apparatus, generator I giving field strength of stable frequency, generator II having direct current with a synchronous "motorchik," potentiometer having constant current and galvanometer, and results of experiments with the line of internal-conversion electrons from the K-shell (240 keV) of RaC. Conclusion: Accuracy of the method is limited by the stability of frequency of the quartz oscillator, equal to 10^{-5} . Relative error for 500-oersted field is $4 \cdot 10^{-5}$ and decreases with increase in field H , since absolute error is 0.02 oersted. Method is free of necessity of introducing tangential corrections on rectilinear scale, and on nonlinear galvanometer. Submitted 15 Jul 49.

AUTHOR: Fedorov, P. I.; Tsimbalist, V. V. ; Liu, Kuo-yuan

TITLE: Interaction of gallium chloride with zinc, cadmium and mercury chlorides

SOURCE: Zhurnal neorganicheskoy khimii, v. 9, no. 7, 1964, 1681-1683

TOPIC TAGS: gallium zinc chloride, gallium cadmium chloride, gallium mercury chloride, gallium chloride, zinc chloride, cadmium chloride, mercury chloride

ABSTRACT: The work was prompted by the fact that binary systems of gallium chloride with zinc-, cadmium-, and mercury chlorides have not been described in the literature. Chloride mixtures welded in Stepanov's containers (abstractor's note (not explained)) were melted and then slowly cooled with the furnace to achieve the equilibrium state. From all mixtures tested, only those containing less than 25 mol % ZnCl₂ yielded crystalline products. All other melts formed brown transparent vitreous masses. Those containing between 25 and 35 mol% Zn are semiliquid at room temperature. The eutectic point of 30C corresponds 32 mol% Zn. With cadmium, chlorogalliates are formed of the CdCl₂·2GaCl₃ or Cd(GaCl₄)₂ type analogous to chlorogalliates of monovalent elements. Cadmium chlorogalliate melts

Card 1/2

ACCESSION NR: AP4041588

incongruently at 192C and forms a eutectic with gallium chloride (52C) with approximately 5% CdCl₂. With mercury bischloride, mercury chlorogalliate, Hg(GaCl₄)₂ is formed. It melts congruently at 77C and combines with gallium chloride at 55C. Orig. art. has: 3 figures, no formulas, 3 tables.

Variation of qualitative composition of human milk and forms of supplementary feeding. I. V. Tsimbler, A. A. Titayev, and I. M. Ostrovskaya. *Pedlatiya* 1947, No. 5, 99-108.—Studies on 56 women confirmed the long-held idea of constancy of the protein and sugar content of human milk. Considerable variation was found in the fat, vitamin, and mineral content. Low fat level may necessitate the early introduction of supplementary feeding for the infants. Numerous literature references were cited. Lowered vitamin and mineral level in the milk should be corrected not by supplementary caloric feeding, but by suitably selected vitamin-rich foods. The recommended feeding of this type is made up by grinding green vegetables (lettuce, spinach, etc.) with a small amt. of granulated sugar, followed by filtration through cloth; 1-2 mg. vitamin B₁ is added to the macerate to protect vitamin C from oxidation. Several trials made with this type of supplement are reported favorably.
G. M. Kosolapoff

Established the presence of a particular thermostable substance combining with the coenzyme in extracts from spontaneous malignant human tumors (cancer of the stomach, mammary gland, esophagus). In extracts from benign human tumors (fibroma or cysts) no substance was observed to combine with the coenzyme. Submitted by Acad A. V. Palladin 16 Jun 49.
